How the Agent Calculates Channel Assumptions

A plain-language guide for the developer: the full flow, every calculation step by step with real numbers, and how to check your build. No code, only flow, tables and worked examples.

FLOW | 12 STEPS | WORKED NUMBERS | RATING TABLES | CHECK CASES

Covers 20 countries and 28 industries, 7 offline channels (events, partnerships, BD meetings) and 4 deal types. All starting numbers are priors to be reviewed, not market data.

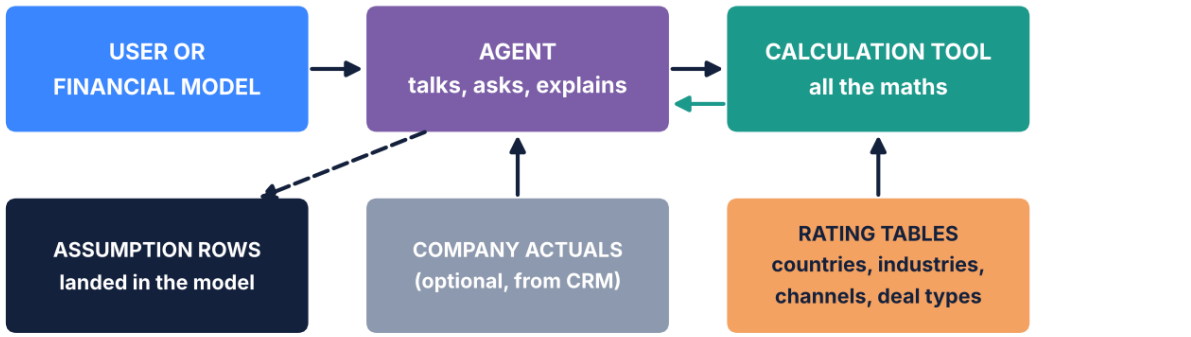

Version 0.3 | 14 November 2026 | Supersedes the earlier build guide that contained code

START HERE

What the agent does, in one page

Your financial model needs assumptions for channels that a CRM rarely captures: **events, partnerships and business-development conversations**. The agent produces them for any of your **20 countries**, **28 industries**, **4 deal types** and **7 channels**. It does this with one repeatable method: every channel has a **base funnel** for a neutral market, and the country and the industry **push each step of that funnel up or down**.

You give the agent	The agent gives back
Country, industry, deal type (SMB, enterprise, government, consumer), channel, and optionally your own CRM results and a monthly plan.	Leads per activity, share qualified, share becoming opportunities, share won, days to close, deals per activity, a low and a high value for each, a label saying whether the number is a prior or based on your data, the top reasons, and any warnings.

Rule: the agent never does the arithmetic and never invents a number. The tool returns every number with its source label.

Figure 1. Who does what. The agent talks and explains; a calculation tool does all the maths from rating tables.

The seven channels and what one 'unit' of activity means

Channel	What it is	One unit is
EVT_EXHIBIT	Event: exhibition / booth	event participation
EVT_HOSTED	Event: hosted roundtable / workshop	hosted event
PAR_RESELLER	Partnership: reseller / distributor	active partner month
PAR_STRATEGIC	Partnership: strategic / co-sell / integration	active partner month
PAR_REFERRAL	Partnership: referral	active partner month
BD_COLD	BD conversation: cold / outbound meeting	meeting held
BD_WARM	BD conversation: warm intro / network meeting	meeting held

The twelve steps the agent follows are shown as a flow on the next page; each step has its own section after it.

Figure 2. The full flow for one request. Red boxes end the request; the agent never guesses past them.

STEP 1

Receive the request

Goal: Collect exactly the inputs the calculation needs, and ask for anything missing.

Input	Required?	Allowed values	If missing or unclear
Country	Yes	The 20 countries in the list (Appendix A), plus accepted aliases	Ask the user which supported country they mean.
Industry	Yes	The 28 industries in the list (Appendix B), plus aliases	Ask.
Deal type	Yes	B2B SMB, B2B enterprise, B2G (government), B2C (consumer)	Ask: who is the buyer, and how large?
Channel	Yes	The 7 channels above	Ask which activity they are planning.
Company actuals	No	Per stage: how many succeeded out of how many tried; leads and units; average days and how many deals	Proceed with priors and say so.
Monthly plan	Only for a forecast	Per month: units of activity, plus partner age in months for partnership channels	Ask for planned volumes.
Average deal value (ACV)	Only for revenue	A number from the financial model	Ask. Never infer.
Unit costs	Only for cost per deal	Cost of one event, one partner-month, one meeting	Ask. The calculation tool does not know costs.

STEP 2

Match the names

Goal: Accept the way people really type names, never guess a different one.

1. Compare the typed name with each supported name, ignoring upper and lower case. If it matches, use the supported spelling.
2. Otherwise look the typed name up in the alias list (Appendix A and B). If found, use the mapped name.
3. Otherwise stop. Tell the user the name is not supported and show the supported list so they can choose.

Typed	Used	Why
Uae (as written in your countries file)	UAE	Same name, different capitals
KSA	Saudi Arabia	Alias
turkiye	Turkey	Alias; your list says Turkey
ecommerce	E-Commerce	Alias
proptech	PropTech & ConTech	Alias
Atlantis	Stop	Not supported: ask the user

STEP 3

Check the combination

Goal: Do not produce numbers for a deal type and channel the model does not cover.

Deal types B2B SMB, B2B enterprise and B2G are modelled for all seven channels. **B2C is modelled only for four channels**: exhibition, hosted event, referral partner and reseller partner. If the request asks for B2C with cold BD, warm BD or a strategic partnership, stop and answer **NOT APPLICABLE** with the reason. Do not substitute another channel.

STEP 4

Check the country gate

Goal: Stop before any number appears for countries where operating is restricted or uncertain.

Gate	Countries (prior, to be confirmed by your compliance team)	What the agent does
Normal	Saudi Arabia, UAE, Qatar, Kuwait, Bahrain, Oman, Egypt, Jordan, Morocco, Tunisia, Turkey	Continue.
Elevated	Lebanon, Algeria, Iraq, Palestine	Continue, add the warning 'elevated operating risk; treat ranges as wide and confirm with the local team'.
Review required	Libya, Iran, Syria, Sudan, Yemen	**Stop.** Return REVIEW REQUIRED, no numbers, and say compliance review is needed (sanctions, conflict or access constraints). Never estimate by copying another country.

The gate is a starting prior, not legal advice. Your compliance team owns the current status of each country.

STEP 5

Look up the ratings

Goal: Describe the country and the industry with a small set of numbers the formulas can use.

Each country has **nine ratings** and each industry **six ratings**, each from 1 to 5, with 3 meaning neutral. The full tables are in Appendices A and B; the meaning of each rating is below.

Country rating	1 means	5 means
Relationship dependence	Transactional, contract-first	Deals need personal trust and introductions
Digital procurement	Paper and phone procurement	E-procurement and e-signature are normal
Decision speed	Very slow approvals	Decisions in days or weeks
Event ecosystem	Few relevant events	Dense calendar of major events
Partner ecosystem	Few credible distributors or integrators	Deep partner base
Reachable buyers	Few reachable buyers	Large reachable buyer base
State share of demand	Private-sector led	State drives most demand
Friction (payments, contracts, FX)	Smooth	Long delays, FX or enforcement problems (higher is worse)
Local-language need	English is enough	Local language near-mandatory (recorded, not yet used)

Industry rating	1 means	5 means
Sales-cycle length	Days to weeks	Nine months or more
Ticket size	Small deals	Very large deals
Partner dependence	Direct sales	Partner-led
Event dependence	Rarely buy via events	Events are the main discovery route
Regulation / approvals	None	Licences and approvals needed
Buying-committee size	One decision maker	Large committee

STEP 6

Turn ratings into five shifts

Goal: Measure how far the country and industry are from neutral, then total their effects stage by stage.

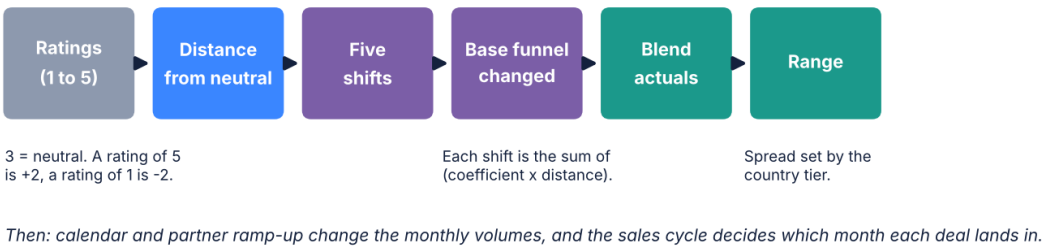

Figure 3. From ratings to a range. Steps 6 to 9 in one picture.

1. **Distance from neutral.** For every rating, distance = rating minus 3. A rating of 5 gives +2, 4 gives +1, 3 gives 0, 2 gives -1, 1 gives -2. Ratings at 3 have no effect and can be skipped.
2. **Look up the channel's sensitivity table** (Appendix C). For each of five stages it lists which ratings matter and by how much (a coefficient). The five stages are: **V** leads per unit, **Q** share qualified, **O** share becoming opportunities, **W** share won, **T** days to close.
3. **For each stage, multiply every listed rating's distance by its coefficient, and add the results.** That total is the stage's **shift**. Keep each individual product: the three largest become the 'reasons' shown to the user.

4. **B2G only:** add one more term to the leads shift: 0.12 multiplied by the country's distance for 'state share of demand'.

STEP 7

Apply the shifts to the channel's base funnel

Goal: Produce leads, the three rates, the days to close and the deals per unit.

Start from the channel's base values (Appendix C) and the deal type's adjustments (Appendix D). Two kinds of numbers are treated differently:

Kind	Which	How the shift is applied	Why
Counts and days	Leads per unit, days to close	Multiply the base by the deal-type multiplier and by **e raised to the power of the shift**.	Effects stack as percentages and can never make a count negative.
Rates (shares)	Qualified, opportunity, win	Convert the base rate to log-odds, add the deal-type shift and the stage shift, convert back.	Keeps every rate strictly between 0% and 100% however extreme the market.

The two conversions, in plain maths

log-odds of a rate p = natural log of (p divided by (1 minus p))

rate from log-odds x = 1 divided by (1 plus e raised to the power of minus x)

Example: a base rate of 0.60 has log-odds 0.4055. Adding a shift of +0.05 gives 0.4555, which converts back to 0.6119, so the rate rises from 60.0% to 61.2%.

The five results

Leads per unit = base leads x deal-type multiplier x e^(leads shift)

Qualified, opportunity and win rates = convert back(log-odds of base rate + deal-type shift + stage shift)

Days to close = base days x deal-type multiplier x e^(cycle shift)

Deals per unit = leads x qualified x opportunity x win

Units needed for one deal = 1 divided by deals per unit

Two things that cause most mistakes

1) Never add percentage points to a rate. Always shift the log-odds. 2) For B2G, add the extra 0.12 state-demand term to the leads shift **before** computing leads.

WORKED EXAMPLE

One full calculation, every number

Request: **Saudi Arabia, E-Commerce, B2B enterprise, strategic partnership**. Reproduce each line; if your numbers differ, the first differing line is where the problem is.

A. Distances from neutral (ratings that are not 3)

Rating	Value	Distance
Country: Relationship dependence	5	+2
Country: Event ecosystem strength	5	+2
Country: Partner / channel ecosystem maturity	4	+1
Country: Reachable buyer density	5	+2
Country: State share of demand	5	+2
Country: Payment / contract / FX friction	2	-1
Country: Local-language need	4	+1
Industry: Partner dependence	4	+1
Industry: Event dependence	4	+1

Rating	Value	Distance
Industry: Regulation / approvals exposure	2	-1

B. Shifts: coefficient x distance, added up per stage

Stage	Terms (coefficient x distance = product)	Shift
Leads (V)	Country: Partner / channel ecosystem maturity: +0.10 x +1 = +0.10 Industry: Partner dependence: +0.10 x +1 = +0.10 Country: State share of demand: +0.04 x +2 = +0.08	+0.280
Qualified (Q)	Country: Partner / channel ecosystem maturity: +0.05 x +1 = +0.05	+0.050
Opportunity (O)	Country: Partner / channel ecosystem maturity: +0.05 x +1 = +0.05 Country: Relationship dependence: +0.06 x +2 = +0.12	+0.170
Win (W)	Country: Relationship dependence: +0.06 x +2 = +0.12 Country: Payment / contract / FX friction: -0.07 x -1 = +0.07 Industry: Regulation / approvals exposure: -0.06 x -1 = +0.06	+0.250
Days to close (T)	no listed rating differs from neutral	+0.000

C. Apply to the base funnel (strategic partnership base: 1.7 leads, 60% qualified, 45% opportunity, 30% win, 180 days; B2B enterprise has no adjustment)

Quantity	Calculation	Result
Leads per partner-month	1.7 x e^(+0.280)	2.2493
Qualified rate	log-odds of 0.6 = +0.4055; add 0 and +0.050 = +0.4555; convert back	0.6119
Opportunity rate	log-odds of 0.45 = -0.2007; add 0 and +0.170 = -0.0307; convert back	0.4923
Win rate	log-odds of 0.3 = -0.8473; add 0 and +0.250 = -0.5973; convert back	0.3550
Days to close	180 x e^(+0.000)	180.00
Deals per partner-month	2.2493 x 0.6119 x 0.4923 x 0.3550	0.2405
Partner-months for one deal	1 divided by 0.2405	4.16

Same request for Egypt gives: leads 2.1611, win rate 0.3106, 195.0 days, 0.1961 deals per partner-month. Friction (payments, contracts, FX) is the main reason Egypt is lower.

D. The reasons shown to the user

For each stage, sort the products by size (ignoring the sign) and keep the top three. For leads and days, show the effect as a percentage change: (e^(product) minus 1) x 100. For rates, show the log-odds shift. Win-rate reasons here: Country: Relationship dependence (rating 5) +0.12; Country: Payment / contract / FX friction (rating 2) +0.07; Industry: Regulation / approvals exposure (rating 2) +0.06.

STEP 8

Blend in company actuals

Goal: As real results arrive, move away from the prior toward the data, and label the result honestly.

Only do this if the user or CRM supplied results. Only the stages that have results are changed; everything else stays at its prior from Step 7. Three constants are used: **15** for rates, **3** for lead volume, **5** for days.

Quantity	Formula in words
Each rate (qualified, opportunity, win)	(prior rate x 15 + number of successes) divided by (15 + number of trials)
Leads per unit	(prior leads x 3 + actual leads) divided by (3 + actual units)
Days to close	(prior days x 5 + actual average days x number of deals) divided by (5 + number of deals)
Amount of evidence	The largest of: the number of trials of any rate, 5 times the actual units, the number of deals timed.
Source label	No actuals: **prior**. Evidence below 50: **blended**. Evidence 50 or more: **company actuals**.
Spread of the range	Divide the spread by the square root of (1 + evidence divided by 15). More evidence, narrower range.

Why these constants: 15 means 15 real trials carry the same weight as the prior. Change them only with the business owner.

Worked example: Egypt, SaaS, B2B enterprise, warm BD meetings; the company actually won 2 of 40 opportunities

Quantity	Calculation	Result
Prior win rate	from Step 7	0.3127
Blended win rate	(0.3127 x 15 + 2) divided by (15 + 40)	0.1217
Evidence and label	40, which is below 50	blended
Spread before	tier B country (see Step 9)	0.3640
Spread after	0.3640 divided by the square root of (1 + 40/15)	0.1900

STEP 9

Work out the range

Goal: Never give one number alone. The range is wider where the evidence is weaker.

1. **Country spread by tier:** A = 0.25, B = 0.35, C = 0.45, D = 0.60 (tiers are in Appendix A).
2. **Combine with the industry spread of 0.10:** total spread s = the square root of (country spread squared + 0.10 squared). Tier A gives 0.2693, B gives 0.3640, C gives 0.4610.
3. **Rates:** the low value is the rate converted from (its log-odds minus 1.2816 x s); the high value uses plus. 1.2816 marks the 10th and 90th percentile.
4. **Leads and days:** low = value x e^(minus 1.2816 x s); high = value x e^(plus 1.2816 x s).
5. **Deals per unit:** it combines four uncertain numbers, so simulate it: draw 4,000 random sets in which each of leads, qualified, opportunity and win varies by the spread s, multiply them, sort the 4,000 results, and read the 10th and 90th percentile. Use a fixed random seed so repeating a request gives the same answer.

The simulated range depends on the random generator, so another build will match within about 5%, not exactly. Everything else in this guide must match exactly.

STEP 10

Adjust for the calendar and partner ramp-up

Goal: Business slows in Ramadan, Eid and summer, and a new partner takes months to become productive. Only needed for a monthly plan.

Effect	Rule	Notes
Ramadan	For each month, find the share of its days that fall inside Ramadan. Volume is multiplied by (1 minus share x country sensitivity x 0.35). Days to close are multiplied by (1 plus share x country sensitivity x 0.25).	Dates for 2026 to 2028 are approximate: 2026: 18 Feb to 19 Mar; 2027: 8 Feb to 9 Mar; 2028: 28 Jan to 25 Feb. Confirm yearly.
Eid al-Adha	Five days from the start date. Volume multiplied by (1 minus share x country sensitivity x 0.50).	Start dates: 27 May 2026, 16 May 2027, 5 May 2028 (approximate).
Summer	July and August: volume x 0.85, days to close x 1.1.	A prior: tune per country from your own calendar.
Country sensitivity	A number from 0 to 1 per country (Appendix A): 1.0 for the Gulf, 0.9 Egypt and most of North Africa, 0.5 for Turkey and Lebanon.	Scales Ramadan and Eid effects.
Partner ramp-up	Productivity = partner age in months divided by ramp months, never above 100%. Ramp months: reseller 4, strategic 6, referral 2. Events and BD have no ramp.	If the age is not given, assume 100% and warn.

Worked example: Saudi Arabia, February 2027

Step	Calculation	Result
Ramadan 2027 window	8 Feb to 9 Mar	-
Days of February inside it	8 Feb to 28 Feb	21 of 28 days
Share	21 divided by 28	0.7500
Volume multiplier	1 minus 0.75 x 1.0 x 0.35	0.7375
Days-to-close multiplier	1 plus 0.75 x 1.0 x 0.25	1.1875
October 2027 (no events)	both multipliers	1.0000 and 1.0000

STEP 11

Place deals in the months they will land

Goal: Revenue arrives after the sales cycle, not in the month of the activity.

1. For each plan row, multiply: units (after ramp-up) x leads per unit x the month's volume multiplier = leads. Then x qualified rate = qualified. Then x opportunity rate = opportunities. Then x win rate = deals. Leads, qualified and opportunities are recorded in the activity month.
2. Convert days to months: days to close x the month's days-to-close multiplier, divided by 30.
3. Split the deals into five parts with weights 15%, 25%, 30%, 20%, 10%. Part 1 lands after 0.6 x the cycle in months, part 2 after 0.8, part 3 after 1.0, part 4 after 1.2, part 5 after 1.5.
4. If a delay is not a whole number of months, split that part between the two neighbouring months in proportion to the fraction (for example 2.4 months: 60% in month 2, 40% in month 3).
5. Add the parts for all rows. If an average deal value is given, revenue = deals x deal value. Add the low and high deals the same way using the low and high deals per unit.

Worked example: UAE, SaaS, B2B enterprise, warm BD; 20 meetings in April 2027

Days to close 92.31 (April has no Ramadan or Eid, so multipliers are 1.0), which is 3.077 months. Total deals from 20 meetings = 1.8386.

Part	Weight	Delay (months)	Whole + fraction	Lands in
0.6 x cycle	15%	1.846	1 + 0.846	2027-05 (15%) and 2027-06 (85%)
0.8 x cycle	25%	2.462	2 + 0.462	2027-06 (54%) and 2027-07 (46%)
1.0 x cycle	30%	3.077	3 + 0.077	2027-07 (92%) and 2027-08 (8%)
1.2 x cycle	20%	3.692	3 + 0.692	2027-07 (31%) and 2027-08 (69%)
1.5 x cycle	10%	4.616	4 + 0.616	2027-08 (38%) and 2027-09 (62%)

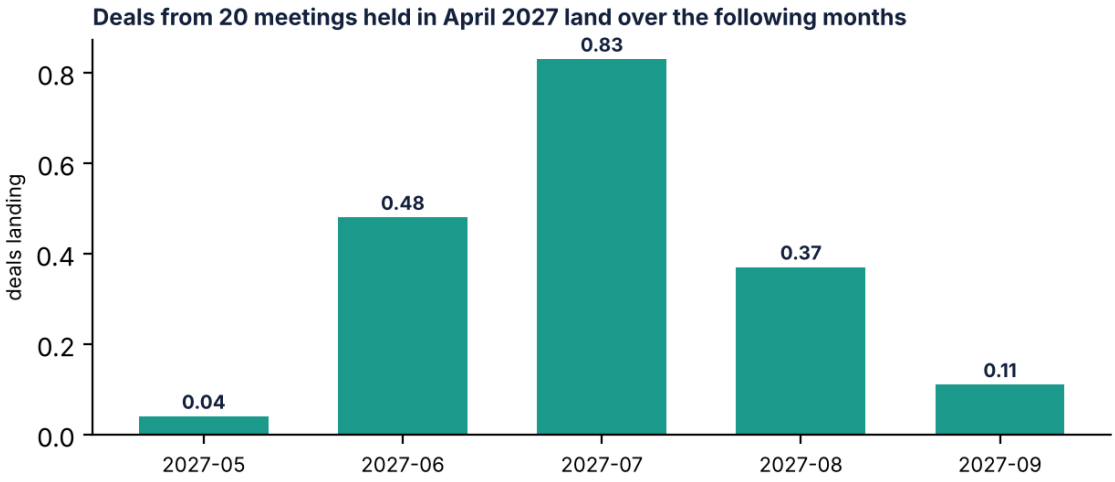

Figure 4. The five parts, added by month. They sum to 1.839, the total above: no deals are created or lost. This is a required check.

STEP 12

Write the assumption rows and explain

Goal: Give the financial model flat rows it can load and audit, and give the user a clear explanation.

Write six rows per combination: leads per unit, qualified rate, opportunity rate, win rate, days to close, deals per unit. Each row has these fields:

Field	Content
Name	country, industry, deal type, channel and metric joined in lower case, for example saudi_arabia.e-commerce.b2b_ent.par_strategic.win_rate
Value, low, high	The base value and the 10th and 90th percentile values.
Unit	For example 'share of opportunities won' or 'days'.
Source label	Prior, blended or company actuals. Never empty.
Reasons	The top three reasons (Step 7D).
Warnings	Any warnings from the checks (elevated country, ramp not applied, and so on).
Needs human review	Yes when: the label is prior and the channel is a large share of planned pipeline; or the country is elevated; or a person overrode a rating.

How the agent talks to the user

Moment	What the agent does
Start	Confirm country, industry, deal type and channel in one sentence. Ask for anything missing from Step 1.
Unknown name	Say which name is not supported, list the supported ones, ask the user to choose.
Stopped by a check	Say plainly: 'Not applicable: B2C is not modelled for this channel' or 'Review required: compliance must confirm this country first'. Offer no numbers.
Numbers returned	Show the base value and the range together. Say the label in plain words ('prior estimate' or 'based on your CRM data').

Moment	What the agent does
Explaining	Give the single biggest reason in one sentence, for example 'Closing is slower in Egypt mainly because of payment and contract friction.'
Close	Say what will improve the numbers: send CRM results for this channel and country.

CHECK YOUR BUILD

Test cases with expected answers

All values below come from the reference calculation. Match leads, rates and the spread exactly (four decimals) and days to two decimals. 'Deals per unit' matches exactly; only its low and high range is simulated.

#	Country / industry / deal type / channel	Leads	Qual.	Opp.	Win	Days	Deals / unit	Spread
1	Saudi Arabia / E-Commerce / B2B enterprise / PAR_STRATEGIC	2.2493	0.6119	0.4923	0.3550	180.00	0.2405	0.2690
2	Egypt / E-Commerce / B2B enterprise / PAR_STRATEGIC	2.1611	0.6119	0.4773	0.3106	194.99	0.1961	0.3640
3	UAE / SaaS / B2B SMB / BD_WARM	1.4512	0.4998	0.5073	0.4068	55.39	0.1497	0.2690
4	Egypt / FinTech / B2G / EVT_EXHIBIT	67.8751	0.2673	0.2695	0.1317	397.53	0.6436	0.3640
5	Turkey / Gaming / B2C / EVT_HOSTED	85.4121	0.4662	0.5451	0.1627	22.50	3.5305	0.3640
6	Qatar / AI / B2B enterprise / BD_COLD	0.8353	0.1756	0.3145	0.1365	190.69	0.0063	0.2690
7	Iraq / Logistics / B2B enterprise / PAR_RESELLER	2.4261	0.5000	0.4072	0.2144	172.54	0.1059	0.4610

#	Situation	Expected answer
8	Iran / AI / B2B enterprise / warm BD	REVIEW REQUIRED. No numbers at all. Message mentions compliance review.
9	UAE / Gaming / B2C / cold BD	NOT APPLICABLE. Message says B2C is not modelled for this channel.
10	Iraq (case 7)	Numbers returned plus exactly one warning about elevated operating risk.
11	Typed 'Uae' and 'ecommerce' instead of UAE and E-Commerce	Same numbers as the supported names.
12	Egypt / SaaS / B2B enterprise / warm BD with 2 wins in 40	Win rate 0.1217 (prior 0.3127); label 'blended'; spread 0.1900.
13	Saudi Arabia calendar multipliers: February 2027 and October 2027	Volume 0.7375, days 1.1875; and volume 1.0000, days 1.0000.
14	Forecast: UAE SaaS B2B enterprise warm BD, 20 meetings in April 2027	Total deals 1.8386; they land in 2027-05, 2027-06, 2027-07, 2027-08, 2027-09; the monthly parts add back to the total.

Rules that must always hold

- Every rate is strictly between 0 and 1, and the low value is below the base which is below the high value.
- Deals per unit always equals leads x qualified x opportunity x win.
- The same request twice gives the same answer.
- More payment friction never raises the win rate. More relationship dependence never raises the qualified rate of cold BD.
- Forecast deals always add up: total over all months = units x ramp x calendar volume x deals per unit.
- No answer ever contains numbers when the status is REVIEW REQUIRED or NOT APPLICABLE.
- Every number shows its source label.

Full-table check

The reference table has 20 countries x 28 industries x 25 valid deal-type and channel pairs = **14,000 rows**. The 15 countries that are not gated give 10,500 rows with numbers; the 5 gated countries give 3,500 rows marked REVIEW REQUIRED with no numbers. (25 pairs: three deal types x 7 channels = 21, plus B2C with 4 channels.) Compare your results with it, skipping the simulated low and high of deals per unit.

MAINTENANCE

Edge cases, changes and what not to build

Situation	What to do
Month not in year-month form	Reject the plan row with a clear message.
Year with no Ramadan dates in the tables	No Ramadan effect; add a warning.
Plan row for a gated country	Fail the whole forecast and say which row and why. Never drop a row silently.
Partner age missing for a partnership channel	Assume full productivity and warn that ramp-up was not applied.
Actuals with zero trials	Ignore them.
Empty plan	Return an empty forecast.
Deals per unit is zero or not a number	Treat as a defect. Do not show a number.
Rounding	Calculate with full precision, round only for display: leads 2 decimals, rates 4, days 1.

How the business changes the behaviour (no development needed, only table edits)

I want to...	Change this
Re-rate a country or industry	The rating (1 to 5) in the table. Re-run the check cases.
Open a gated country	Its gate, after compliance sign-off. Record who approved and when.
Add a country or industry	Add its ratings, name and aliases to the tables.
Make a rating matter more or less	Its coefficient in the channel's sensitivity table (Appendix C).
Add a channel	Add its base funnel, ramp months and five sensitivity lists, and say which deal types allow it.
Use the local-language rating	Decide where it matters and add it to those sensitivity lists.
Replace priors with real results	Feed actuals (Step 8). When there are enough deals, refit base values and coefficients and keep a version log.

Not part of this calculation

- Cost of events, partners or travel: comes from the financial model (cost per deal = units per deal x unit cost).
- Average deal value, currency conversion and pricing.
- Overlap between channels (one lead credited to both an event and a partner) and extra effects when a particular industry meets a particular country.
- Predicting any single deal: the output is an average with a range.

Honest status of the numbers

All base values, all 15 ratings per country-industry pair, the coefficients and the calendar constants are **expert starting estimates (priors)**, not measured data. The developer builds the mechanics exactly as written. The business reviews the priors and feeds in actuals. Every output carries its source label so the difference is always visible.

APPENDIX A

Country table

Country	Tier	Gate	Rel	Dig	Spd	Evt	Par	Mkt	Gov	Fric	Loc	Ramadan sens.
Saudi Arabia	A	normal	5	3	3	5	4	5	5	2	4	1
UAE	A	normal	4	5	4	5	5	4	3	1	2	1
Qatar	A	normal	5	4	3	3	3	2	5	2	3	1
Kuwait	A	normal	5	3	2	2	3	2	5	3	4	1
Bahrain	A	normal	4	4	3	3	3	1	4	2	3	1
Oman	A	normal	5	3	2	2	2	2	5	3	4	1
Egypt	B	normal	4	3	2	4	4	5	4	4	5	0.9
Jordan	B	normal	4	3	3	3	3	2	4	3	4	0.9
Morocco	B	normal	4	3	2	3	3	3	4	3	4	0.9
Tunisia	B	normal	4	3	2	2	2	2	4	4	4	0.9
Turkey	B	normal	3	4	3	4	4	5	3	4	5	0.5

Sustainability	4	4	4	4	5	4
FoodTech	3	3	4	5	4	3

Accepted aliases: 'ecommerce' = E-Commerce, 'e commerce' = E-Commerce, 'proptech' = PropTech & ConTech, 'contech' = PropTech & ConTech, 'cybersecurity' = Cyber Security, 'data & analytics' = Data and Analytics, 'data analytics' = Data and Analytics, 'artificial intelligence' = AI, 'cloud' = CloudTech, 'health tech' = HealthTech, 'ed tech' = EdTech, 'fin tech' = FinTech, 'agri tech' = AgriTech, 'food tech' = FoodTech, 'ad tech' = AdTech, 'media tech' = MediaTech, 'sport tech' = SportTech, 'auto tech' = AutoTech, 'travel tech' = TravelTech, 'invest tech' = InvestTech, 'telecom' = Telecommunications, 'biotech' = Biotechnology.

APPENDIX C

Channel tables: base funnel and sensitivities

Channel	Unit	Leads / unit	Qual.	Opp.	Win	Days	Ramp (mo)	Deals / unit
EVT_EXHIBIT Event: exhibition / booth	event participation	60	25%	30%	20%	120	0	0.900
EVT_HOSTED Event: hosted roundtable / workshop	hosted event	25	40%	35%	25%	90	0	0.875
PAR_RESELLER Partnership: reseller / distributor	active partner month	2.5	50%	40%	25%	150	4	0.125
PAR_STRATEGIC Partnership: strategic / co-sell / integration	active partner month	1.7	60%	45%	30%	180	6	0.138
PAR_REFERRAL Partnership: referral	active partner month	1	70%	50%	35%	75	2	0.122
BD_COLD BD conversation: cold / outbound meeting	meeting held	1	20%	35%	15%	150	0	0.010
BD_WARM BD conversation: warm intro / network meeting	meeting held	1	45%	45%	30%	100	0	0.061

Base funnel for a neutral market and a B2B enterprise deal. Priors.

Channel	Leads (V)	Qualified (Q)	Opportunity (O)	Win (W)	Days (T)
EVT_EXHIBIT	event ecosystem +0.10 reachable buyers +0.08 event dependence +0.10 digital -0.03	event ecosystem +0.05 event dependence +0.08 ticket -0.04	relationship +0.04 speed +0.04 committee -0.05	friction -0.08 relationship +0.05 regulation -0.06 committee -0.05	cycle length +0.12 speed -0.10 state demand +0.05 regulation +0.08 committee +0.06
EVT_HOSTED	relationship +0.06 reachable buyers +0.04 event dependence +0.05	relationship +0.10 ticket +0.03	relationship +0.08 speed +0.04	relationship +0.08 friction -0.08 regulation -0.05 committee -0.04	cycle length +0.10 speed -0.10 regulation +0.06

Channel	Leads (V)	Qualified (Q)	Opportunity (O)	Win (W)	Days (T)
PAR_RESELLER	partner ecosystem +0.15 reachable buyers +0.08 partner dependence +0.12	partner ecosystem +0.06 partner dependence +0.06	partner ecosystem +0.05 relationship +0.04	partner ecosystem +0.06 friction -0.07 regulation -0.05	cycle length +0.12 partner ecosystem -0.06 speed -0.08 regulation +0.07
PAR_STRATEGIC	partner ecosystem +0.10 partner dependence +0.10 state demand +0.04	partner ecosystem +0.05 ticket +0.04	partner ecosystem +0.05 relationship +0.06 committee -0.06	relationship +0.06 friction -0.07 regulation -0.06 committee -0.05	cycle length +0.14 committee +0.08 speed -0.08
PAR_REFERRAL	partner ecosystem +0.08 relationship +0.08 partner dependence +0.05	relationship +0.08	relationship +0.08	relationship +0.08 friction -0.07 regulation -0.04	cycle length +0.08 speed -0.08
BD_COLD	reachable buyers +0.06 relationship -0.06	relationship -0.10 digital +0.04	relationship -0.08 speed +0.05	relationship -0.04 friction -0.07 regulation -0.05 committee -0.05	cycle length +0.12 speed -0.10 relationship +0.06
BD_WARM	relationship +0.06 reachable buyers +0.05	relationship +0.10	relationship +0.08 speed +0.05	relationship +0.08 friction -0.07 regulation -0.05 committee -0.04	cycle length +0.10 speed -0.08 state demand +0.04

Coefficient per rating step. 'country' ratings are the first nine tables' columns; 'industry' ratings the six in Appendix B. Example: BD_COLD qualified rate has relationship -0.10: every step of relationship dependence above neutral lowers the log-odds of a cold meeting qualifying by 0.10.

APPENDIX D

Deal-type adjustments

Deal type	Leads multiplier	Qualified shift	Opportunity shift	Win shift	Days multiplier	Channels
B2B_SMB	1.3	+0.1	+0.1	+0.2	0.6	all 7
B2B_ENT	1	+0	+0	+0	1	all 7
B2G	0.7	+0	-0.1	-0.3	1.8	all 7
B2C	3	+0.3	+0.8	-0.5	0.25	exhibition, hosted event, referral, reseller

Shifts are in log-odds. B2G also adds 0.12 x (state-demand distance) to the leads shift.
